Does SPY follow the Fibonacci levels — and turn at :45?

SPY 5-minute bars, 2020-07-27 to 2026-10-13 (1,555 sessions) · IE Pro ONE v2's own auto-Fib ("Latest leg", 156 bars) · rules written and committed before the data was read

FIBONACCI LEVELS

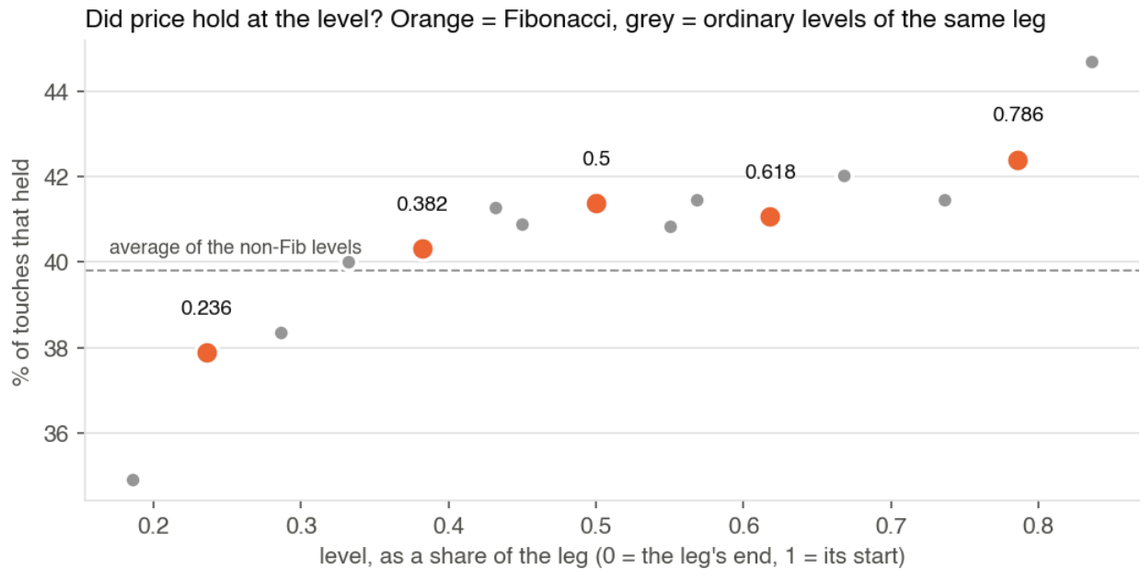

No more respected than any other level

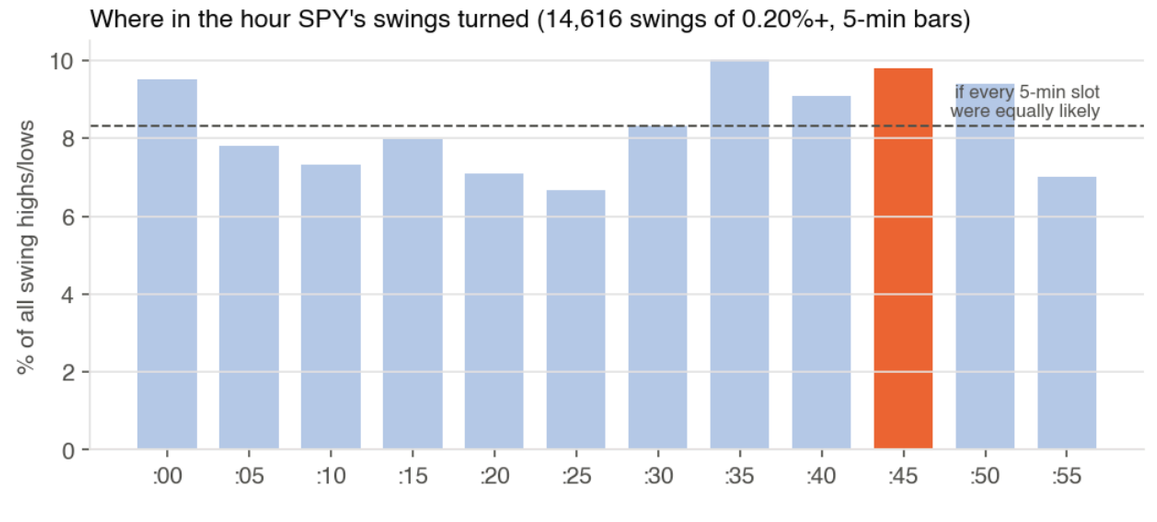

Fib levels held 40.1% of 13,578 touches; ordinary levels of the same legs held 39.8% — difference +0.3 pts (95% range -0.2 to +0.9)

TURNS AT :45

No more turns at :45 than at any other minute

1,433 of 14,616 swings turned on a :45 bar vs 1,424 expected by chance — 1.01× (95% range 0.96–1.05); bigger swings (0.30%): 1.02×

Your chart today, the way you read it

Each Fibonacci level against its two neighbours (±0.05 of the leg)

level	held	neighbours held	difference	touches
0.236	37.9%	36.4%	+1.4 pts	4,287
0.382	40.3%	40.6%	-0.3 pts	3,098
0.5	41.4%	40.9%	+0.5 pts	2,482
0.618	41.1%	41.7%	-0.7 pts	2,048
0.786	42.4%	43.0%	-0.6 pts	1,663

Why it feels true

- A leg has 7 drawn lines. Price is almost always near one of them, so every bounce lands "on a Fib".
- Price holds at *any* level about 40% of the time — Fib or not. Holding at 0.618 looks special only when the misses aren't counted.
- :40–:50 covers a quarter of every hour. Today 4 of 7 turns fell there — the rest didn't, and those don't stick in memory.
- Smaller swings (0.10%, the size you saw today — added after looking at today's chart): 3,026 of 31,242 turned on :45 vs 2,948 expected — 1.03× (95% 1.00–1.06).
- The earlier study of your 14 key times (1,549 days) found the same: turns 50.4% at your times vs 49.8% beside them.

fib_hour45_study.py (pre-registered, commit 634568b) · results/fib_hour45_study.json · 41,040 level touches; dropped: {'both_in_one_bar': 5112, 'unresolved_by_close': 1102, 'touch_bar_extends_leg': 4933} · :40–:50 window 0.97× · RTH bars only (your chart also draws extended hours). A description of SPY, not a signal. Sim-only until Rule 7.
